

Repository Reorganization Summary

Repository Reorganization Summary

Overview

The repository has been restructured into four standardized directories: ``frontend``, ``backend``, ``data``, and ``workspace``. Legacy packages, redundant folders, empty dotfiles, and duplicate code have been removed.

Key Changes

1. **Backend Architecture**:

- Consolidated ``app/`` and ``ai_llms/`` into ``backend/``.
- AI components (registry, router, tools, workflows) organized under ``backend/ai/``.
- RAG, embeddings, vectorstores, and ingestion modules placed in dedicated subdirectories.
- Unified FastAPI routes in ``backend/api/routes.py`` with entry point in ``main.py``.

2. **Frontend Architecture**:

- Flattened ``frontend/sovereign_ai/`` directly into ``frontend/``.
- Removed nested ``.git`` directory for streamlined tracking.
- Verified clean production build using Vite.

3. **Workspace & Data**:

- Standardized workspace subdirectories: ``documents/``, ``input/``, ``projects/``, ``output/``, ``sandbox/``.
- Moved valid artifacts from root ``output/`` to ``workspace/output/``.
- Added ``.gitkeep`` for empty directories and ignored transient files in ``.gitignore``.

4. **Code Optimization**:

- Removed obsolete 0-byte dotfiles (``.bashrc``, ``.zshrc``, ``.idea``, etc.).
- Simplified comments and docstrings to concise descriptions.
- Cleaned test discovery; all 46 test cases pass.

Verification

- **Frontend**: ``npm run build`` completed in 227ms with no errors.

- **Backend**: 46 unit/integration tests executed with 0 failures.

Directories	Purpose
frontend	React application code
backend	Python API and AI components
data	Benchmarking and test documents
workspace	Operational files and outputs
